                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 21,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

probable SCARECROW gene regulator [imported] - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Accession: T02736; A84692
R;Rounsley, S.D.; Lin, X.; Kaul, S.; Shea, T.P.; Fujii, C.Y.; Mason, T.M.; Shen, M.; Ronr submitted to the EMBL Data Library, August 1998
A;Description: Arabidopsis thaliana chromosome II BAC T914 genomic sequence.
A;Reference number: Z14710
A;Status: T02736
A;Status: translated from GB/EMBL/DDBJ
A;Solcule: type: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A; Residues: 1.133 c...

The present sequence represents a Monkey antibody light chain linked to a heavy chain. The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumour cells and in a subpopulation of normal human gastrointestinal epithelial tumour cells and in target structure especially comprises alphaébeta4 integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, in vitro, in vivo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and diagnosis and monitoring premalignant conditions. Quantitative in vivo diagnosis is carried out by determining the localization of antibody to tumour deposits in humans
                                                                                                                                                                 Novel antibody for diagnosis, treatment of human metastatic and malignant diseases, has binding structure for target structure displayed on cell surface of human gastrointestinal epithelial tumor and normal cells.

M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other, and contacting (S) with a primer having the predetermined sequence in the presence of a polymers and nucleotides under conditions suitable for polymerisation of the nucleotides. Also described is an engineered nucleic acid strand (I)
The invention comprises a method (ribosome display system) for obtaining a specific binding pair (sbp) member that binds a complementary sbp member of interest. The method involves incubating mRNA molecules encoding an sbp and lackfing an in-frame stop codon, allowing ribosome translation of the mRNA to produce the encoded sbp member, forming complexes comprising ribosome, mRNA, and encoded sbp member forming the ribosome. The ribosome display system is useful for the selection of an sbp member able to bind a complementary sbp member. The present amino acid sequence represents a GPI-linked cell surface receptor-specific VL CDR3 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other end. M1 is useful for amplifying a nucleic acid. M1 can be used for producing an antibody library. M1 is useful for preparing amplified products that can be 11gated into a suitable expression vector, where the vector can be used to transform an appropriate host organism to produce the polypeptide or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amplifying nucleic acid by contacting engineered nucleic acid strand having predetermined sequence at one end and sequence complementary to predetermined sequence at other end, with primer having predetermined

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be
protein encoded by the target sequence. MI is useful to amplify a family of related sequences to build a complex library such as, for example an antibody library. MI is useful not only for producing large amounts of one target nucleic acid sequence, but also for amplifying simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. ACC62635 to ACC62753 and ABRS4941 to ABRS4998 represent sequence used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulant; immunomodulatory; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimme disorder; immunodeficiency; systemic lupus erythematosuus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Lymphocyte Stimulator (BHyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirhumatic and antiblaDs activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in bloogical samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiathritic, neuroprotective, antiinflammatory, antiatheatic, antiallergic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the Invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of directely from WIPO at ftp.wipo.int/pub/published pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BLys, B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulant; immunomodulatory; antirheumatic;

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13g34 and encodes a protein that is a member of the tumour chromise factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable chany CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including mysathenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as ADS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various

                                                                                                                                                                                                                                                                                                                                                                                                                                  8
```

for the manufacture of medicament for the treatment of cancer or

useful

```
The invention relates to a novel c-Met protein tyrosine kinase antibody or its antigen binding portion that specifically binds to c-Met. The c-Met antibody comprises any one of 160 fully defined sequence of 238, 244, 240, 250, 251, 242, 245, 247, 246, 253, 249, 243, 241, etc., amino acids as given in the specification, or its fragment. The invention comprises a pharmaceutical composition comprising the c-Met protein tyrosine kinase antibody and a carrier; an isolated call that produces the c-Met protein tyrosine kinase antibody; and an isolated nucleic acid molecular that comprises a nucleic acid sequence that encodes a heavy chain or its antigen-binding portion of the c-Met protein tyrosine kinase antibody and antipody. The c-Met protein tyrosine kinase antibody and antipody. The c-Met protein tyrosine kinase antibody and antipody is and osteopathic activities. The c-Met protein tyrosine kinase antibody is
                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         c-Met, tyrosine kinase antibody; antigen binding; cytostatic; ophthalmological; antinflammatory; analgesic; vasotropic; antipsoriatic; osteopathic; cancer; tumnour; ophthalmic disease; glaucoma; retinitis; retinopathy; uveitis; ocular photophobia; macular degeneration; pain; acute injury; eye; hyperproliferative disorder; restenosis; angioplasty;
                  antiinflammatory, antiasthmatic, antiallergic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel c-Met protein tyrosine kinase antibody or its antigen-binding portion specifically binding to c-Met, useful for manufacture of medicament for treating cancer or tumor and for treatment of ophthalmic

           tumour. The c-Met protein tyrosine kinase antibody is useful for diagnosing the presence or ligation of c-Met expressing tissue. The c-Met protein tyrosine kinase antibody is useful for detecting c-Met in a biological sample in vitro or in vivo. The c-Met protein tyrosine kinase antibody is also useful in the treatment or prevention of ophthalmic diseases such as glaucoma, retinitis, retinopathies (e.g., diabetic retinopathy), uveitis, ocular photophobia, macular degeneration and pain associated with acute injury to the eye. The pharmaceutical composition is useful for the treatment of hyperproliferative disorders such as restenosis after angloplasty, and psoriasis, and for the treatment of animals that lack sufficient HGF, e.g. osteoporosis and cancer.                                                                                                                                                                                      sequence represents the protein of a phage display generated human c-Met antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes human proteins with cancer suppressing activity. Also described are the polynucleotides encoding the proteins and a process for preparing the proteins by DNA recombination. The proteins and polynucleotides can be used in the treatment of diseases such as cancer. The present sequence represents a human cancer suppressing protein from the present invention
                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antithenumatic and antiALIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid architis, immunodeficiency (e.g. common variable immunodeficiency (VID) and

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 1344 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scYes) derived, preferably, from the variable contains region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The correspond invention refers to the use of such antibodies in various methods correspond in anappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukamia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various cutivities such as antirheumatic, antiarthritic, neuroprotective, antiarthmatory, antiasthmatic, antiarthritic, and cytostatic. This collypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence as a single chain antibody that binds BLyS of the convention. The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides concoting different immunoglobulin binding protein (1gBP) polypeptides that peptifically bind to a ligand or form one or more disulphide bonds with polypeptides in transferded cells, to generate an IgBP that binds to a ligand, and transformed plant cells are selected, and preparing an IgBP carray in plant cells. At least one peptide sequence has at least 75% sequence identity to a framework region (FR) of a native IgM, IgG, IgM, IgD, IgB, IgY, kappa or lambda immunoglobulin molecule. The method is cueful for preparing an immunoglobulin binding protein array, preferably heavy chain binding protein (GHBP) array in eukaryotic cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic discovery of e.g. screening assays of IgBPs having desired characteristics. The present sequence is a mammalian immunoglobulin characteristics. The present encorporated into an IgBP of the invention

The present invention describes an isolated polymucleotide (1) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1)
an isolated polypeptide that is encoded by the polymucleotide (1), its
complement, despendant or fragment; (3) a genetically engineered
to complement, despendant or infected with the vector of (2);
(4) an antibody specific for the polypeptide of (1); (5) an immunogenic
composition comprising the polypeptide of (1); (5) an immunogenic
composition comprising the polypeptide of (1); (5) an immunogenic
composition comprising the polypeptide of (1); (6) an immunogenic
composition of fragment, or the polymucleotide that is comprising the
captession vector; (6) a pharmaceutical composition comprising the
copypeptide of (1) and a carrier; (7) a protein chip comprising the
copypeptide of (1), and a carrier; (7) a protein chip comprising an array
of the polypeptides of (1), their biological equivalent or fragment; (8)
immunogenic composition; (9) detecting and/or identifying Alloiococcus
cutridis in the biological sample; (10) a kit comprising a concainer,
contraining the novel polymucleotide, its degenerate variant or fragment,
contraining the novel polymucleotide, its degenerate variant or produce the
contraining the novel polymucleotide, its degenerate variant or produce the
contraining assays and (11) producing a polypeptide by culturing the
colymucleotides, polypeptides, antibodies and compositions of the present
correspondention can be used for treating and diagnosing diseases, drug
correning assays and monitoring of effects during dury clinical trials.
The polymucleotides are useful for expressing and detecting Alloiococcus
cutridis. The persent sequence represents an Alloiococcus ottidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Synthetic genes, for both heavy and light chains may be created by combining selected CDR 1, 2, and 3 regions, which may be selected from different antibody mols. having varied binding specificity. The chimaeric anti-RhD antibodies can be used for diagnosis and therapy, and are capable of providing blood-typing reagents of high specificity and reliability. They can also be used in passive immunisation to prevent haemolytic disease of the newborn. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PA

| Sequence 8308, Application US/09949016
| Patent No. 6812339
| Patent No. 6812339
| GENERAL INFORMATION:
| APPLICANT: VENTER, J. Craig et al. |
| TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF |
| TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF |
| TITLE OF INVENTION NUMBER: 05/94/94,016 |
| CURRENT APPLICATION NUMBER: 60/241,755 |
| PRIOR APPLICATION NUMBER: 60/241,755 |
| PRIOR APPLICATION NUMBER: 60/231,768 |
| PRIOR APPLICATION NUMBER: 60/231,498 |
| PRIOR FILING DATE: 2000-10-03 |
| PRIOR FILING DATE: 2000-09-08 |
| NUMBER OF SEQ ID NOS: 207012 |
| SOFTWARE: FastSEQ for Windows Version 4.0 |
             APPLICANT: TTO, Makoto
TITLE OF INVENTION: Gene Encoding Endoglycoceramidase
NUMBER OF SEQUENCES: 15
CORRESPONDENCE ADDRESS:
ADDRESSEE: Birch, Stewart, Kolasch & Birch, LLP
STREET: P.O. Box 747
CITY: Falls Church
STATE: Virginia
COUNTRY: USA
ZIP: 22040-0747
COMPUTER: EADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30 (EPO)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/672,571A
FILING DATE: 28 UNDR 1996
CLASSIFICATION: 435
ATTORNEY/AGATINN:
NAME: WEINER, MACC S.
REGISTRATION NUMBER: 32,181
REPERRENCE/DOCKET NUMBER: 1422-0264P
TELECPMUNICATION INFORMATION:
TELEPHONE: (703) 205-8000
TELEFRX: (703) 205-8000
TELEFRX: (703) 205-8000
TELEFRX: (703) 205-8000
TELEFRX: SEQUENCE CHARACTERISTICS:
LENGTH: 490 amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 38; DB 4; Length 1075; Pred. Patent No. 6083748

GENERAL INFORMATION:
APPLICANT: Cheng, Jill
APPLICANT: Lasky, Laurence A.
TITLE OF INVENTION: A NOVEL KAPPA/MU-LIKE PROTEIN TYROSINE
TITLE OF INVENTION: PHOSPHATASE, PTP LAMBDA
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSER: FLEHR, HOHBACH, TEST, ALBRITTON & HERBERT, LLP
STREET: 4 Embarcadero Center, Suite 3400
Sequence 4, Application US/08769399
Patent No. 5976852

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
